As taken from section 19.3 of [1], the interior point method obtains step direction p by solving

$$\begin{bmatrix} \nabla^2_{xx} L & 0 & A_E^T(x) & A_I^T(x) \\ 0 & \Sigma & 0 & -I \\ A_E(x) & 0 & 0 & 0 \\ A_I(x) & -I & 0 & 0 \end{bmatrix} \begin{bmatrix} p_x \\ p_s \\ -p_y \\ -p_z \end{bmatrix} = - \begin{bmatrix} \nabla f(x) - A_E^T(x)y - A_I^T(x)z \\ z - \mu S^{-1}e \\ c_E(x) \\ c_I(x) - s \end{bmatrix}.$$
 (1)

This equation can be simplified by removing  $p_s$  and then  $p_z$ . The reduced system is then

$$\begin{bmatrix} \nabla_{xx}^2 L + A_I^T(x) \Sigma A_I^T(x) & A_E^T(x) \\ A_E(x) & 0 \end{bmatrix} \begin{bmatrix} p_x \\ -p_y \end{bmatrix} = - \begin{bmatrix} \nabla f(x) - A_E^T(x) y - A_I^T(x) (z - \Sigma c_I(x) + \mu S^{-1}e) \\ c_E(x) \end{bmatrix},$$
(2)

where

$$p_z = -\Sigma A_I(x)p_x + \Sigma c_I(x) - \mu S^{-1}e$$
(3)

$$p_s = -\Sigma^{-1} p_z + s - \mu Z^{-1} e. (4)$$
